download windows xp sp3 lite netbook edition iso-269

that zone must support the SRV resource records (RFC 2782) to advertise the Active Directory directory service. For more information about RFCs, see DNS RFCs.

If the DNS server hosting the authoritative DNS zone is not a server running Windows 2000 or Windows Server 2003, contact your DNS administrator to determine if the DNS server supports the required standards. If the server does not support the required standards, or the authoritative DNS zone cannot be configured to allow dynamic updates, then modification is required to your existing DNS infrastructure.

For more information, see Checklist: Verifying DNS before installing Active Directory and Using the Active Directory Installation Wizard.

Important

The DNS server used to support Active Directory must support SRV resource records for the Locator mechanism to function. For more information, see Managing resource records.

It is recommended that the DNS infrastructure allows dynamic updates of Locator DNS resource records (SRV and A) before installing Active Directory, but your DNS administrator may add these resource records manually after installation. After installing Active Directory, these records can be found on the domain controller in the following location: systemroot\System32\Config\Netlogon.dns

How do you manually create SRV records in DNS?

this is on windows server

go to run ---> dnsmgmt.msc

rightclick on the zone you want to add srv record to and choose "other new record"

and choose service location(srv).....

Name 3 benefits of using AD-integrated zones.

Active Directory–integrated DNS enables Active Directory storage and replication of DNS zone databases. Windows 2000 DNS server, the DNS server that is included with Windows 2000 Server, accommodates storing zone data in Active Directory. When you configure a computer as a DNS server, zones are usually stored as text files on name servers — that is, all of the zones required by DNS are stored in a text file on the server computer. These text files must be synchronized among DNS name servers by using a system that requires a separate replication topology and schedule called a zone transfer However, if you use Active Directory–integrated DNS when you configure a domain controller as a DNS name server, zone data is stored as an Active Directory object and is replicated as part of domain replication.

-1-49-sp3-eula.exe to windows xp sp3 lite netbook edition iso-269-1-49-eula.exe A: Your machine is probably trying to install an unsigned driver from a site that's having issues, which is why you're getting the error you're getting. Open Device Manager, go to the Device tab, right click on the "NETWORK" driver and choose "Update Driver Software". Then navigate to the directory where you have the.exe file you downloaded and you should find your updated file. This worked for me. Good luck. Q: JS - Submitting Form - On Page Load or On Form Submit I have a form which I'm trying to submit with jquery. I have 2 submit buttons (I'm using rails to generate the form). When the user clicks on the first submit button, the page makes a request and updates the record. If the user clicks the second submit button, the page doesn't make the request. So my question is, when the user clicks the submit button, how do I tell if the request is because the user clicked the first submit button or the second submit button? How do I make it so the user can click the first submit button but it does nothing? Thanks! Simple enough: have

two submit buttons (say submit button 1 & submit button 2) and in the onClick callback functions for both do this: if (event.which == 1) { // do stuff for submit button 1 } else if (event.which == 2) { // do stuff for submit button 2 MySQL Group by Rows Please help, I have database with structure as following USERS(Userid, user_name) QUESTIONS(qid, question, category, score,user_id) USERS_QUESTION(user_id, qid, u_name, category, score) I want to get count of each question category for each user. For example: qid | cat | count 82157476af
